DESIGNER DISPLACEMENT FLOW DIFFUSERS

Designer front for displacement flow diffusers

Complementing displacement flow diffusers with a designer front is a request that is being made with increasing frequency by interior architects and designers.

To ensure air flow for the mode of installation, and to maintain the functioning of the displacement flow diffusers, two basic rules are to be adhered to:

- The distance from the front plate to the designer front must be at least 20 mm and max. 50 mm.
- The free cross section of the entire designer front must be at least 50%.
